

Dear Sirs/Madams;

It has come to my attention that a form of Internet service is progressively being tested (or about to be) over existing power lines. This form of cost-efficient Internet access appears on the surface to be an outstanding idea. However, this would wreak havoc on those - like myself - in the Amateur Radio community. It is imperative that interference from such design and implementation be studied and tested before any initial physical labor. As a member of the Amateur Radio community, I would find such interference extremely discouraging. Also, because data would flow through power lines, this may also cause unforeseen interference in home and business Internet connectivity, telephones (home and business), television sets, home theater systems or anything else which requires the use of electricity and radio frequencies.

Thank you for taking the time to read my comments.
